

Appl. No. 10/626,730
Amdt. Dated Sept. 29, 2005
Reply to Office Action of June 29, 2005

Amendments to the Specification:

Please replace paragraph [007] with the following amended paragraph:

[007] A device is provided, having an anode, a cathode, and a first organic layer disposed between the anode and the cathode. The first organic layer is capable of being phosphorescent emissive when a voltage is applied between the anode and the cathode. An organic enhancement layer disposed between the first organic layer and the cathode is also provided. The organic enhancement layer may comprise a material having a lowest unoccupied molecular orbital energy level that is greater than that of the hole transporting material in the first organic layer. In preferred embodiments, the organic enhancement layer comprises a material having a lowest unoccupied molecular orbital energy level that is not more than 0.3 eV less, preferably not more than 0.25 eV less and more preferably not more than 0.15 eV less than the energy level of the lowest unoccupied molecular orbital of the hole transporting material in the first organic layer.
